OTHER RESEARCH PRODUCTS

- *English ASC Treebank*: The ASC Treebank is a linguistically annotated dataset of argument structure constructions (ASCs), informed by research in the usage-based constructionist approach to language learning. The first version of the treebank includes 26,437 annotated ASC tokens, while the second version contains 22,069 tokens. Developed in collaboration with Kris Kyle (University of Oregon)
  - ASC treebank v1: https://github.com/LCR-ADS-Lab/ASC-Treebank
  - ASC treebank v2, annotation manual: https://osf.io/v75qu/?view_

- *Korean lexical diversity python package*: The Korean lexical diversity python package extended the previous TAALED (Tool for the Automatic Analysis of Lexical Diversity; Kyle et al., 2021) tool to calculate a wide variety of lexical diversity indices (e.g., MATTR, MTLD, & HD-D) for Korean. As an agglutinative language, Korean requires more fine-grained parsing at the morpheme level (compared to English), so we provide two versions of the morphological parser: (1) baseline Korean morphological parsers and (2) a fine-tuned L2-Korean morphological parser which improved accuracy in Korean lexical diversity analysis. Developed in collaboration with Sooyeon Cho (Zurich University of Applied Sciences): https://github.com/NLPxL2Korean/Korean-Lexical-Diversity

- *UD Korean-KSL dataset*: This UD Korean-KSL dataset is a dependency treebank of L2 Korean, featuring morpheme and Universal Dependency manual annotations. The latest version (Sep. 2024) contains 12,058 annotated sentences from the written data produced by L2-Korean

learners at various proficiency levels, with the dataset continuing to grow. Developed in collaboration with Gyu-Ho Shin (University of Illinois, Chicago): https://github.com/UniversalDependencies/UD_Korean-KSL/tree/dev
